

## The courses

### **TEP4295 Sustainable engineering**

#### 7.5 ECTS

Concepts, assessment methods and strategies for sustainability.

 Undergraduate, 200-250 students, multicampus

Transformed from a teacher-oriented format last lectured in spring 2020, to a fully online version in 2021, and in 2022 offered as a hybrid (streamed) course in 2023.

## **INGX2300** Engineering systems thinking

#### 10 ECTS

Innovation, entrepreneurship, technology management, and sustainable engineering.

#### Undergraduate, approx. 1 000 students

 Multicampus, all NTNU's bachelor engineering programs in Trondheim, Gjøvik, and Ålesund

Digital, shared course across all bachelor engineer programs 2022 and 2023.

## The courses

### **TEP4295 Sustainable engineering**

#### 7.5 ECTS

Undergraduate, 200-250 students, multicampus

Transformed from a teacher-oriented format last lectured in spring 2020, to a fully online version in 2021, and in 2022 offered as a hybrid (streamed) course in 2023.

## **INGX2300** Engineering systems thinking

#### 10 ECTS

Innovation, entrepreneurship, technology management, and sustainable engineering.

### Undergraduate, approx. 1 000 students

 Multicampus, all NTNU's bachelor engineering programs in Trondheim, Gjøvik, and Ålesund

Digital, shared course across all bachelor engineer programs 2022 and 2023.

### **Defining properties**

- Many students
- Several campuses
- Digital learning environments
- Content that should involve curiosity, reflection, dialogue; engineering within the frame of society.

## Student-centered

"students (...) lead learning activities, participate more actively in discussions, design their own learning projects, explore topics that interest them " (\*)

"teacher tends to be the most active person (...) while students spend most of their time sitting in desks, listening, taking notes, giving brief answers to questions that the teacher asks, or completing assignments and tests" (\*)

Large student numbers require use of the digital environment in **learning activities for sustainable engineering** 

# Digital environment

The digital learning environment is "the totality of systems or applications that support teaching and learning." (\*\*).

Scalable and resource efficient, yet also a challenge for student-centered learning.

<sup>(\*)</sup> https://www.edglossary.org/student-centered-learning/

<sup>(\*\*)</sup> https://www.surf.nl/en/controlling-the-digital-learning-environment

## Sustainable engineering

- Concepts, definitions, terms, goals, strategies, indicators and their status.
- Methods and approaches for evaluating sustainability (industrial ecology methods)
- 3. Professional development for a sustainable future

Knowledge.
What we mean with engineering for sustainability

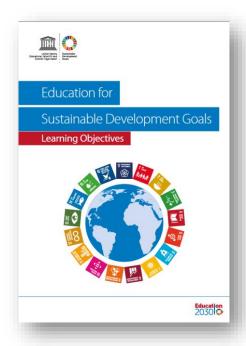

### Skills.

How to evaluate and guide engineering and technology development

### Competences.

key competences for sustainability and sustainable engineers

# UNESCO Key competences for sustainability

#### Systems thinking competency

the abilities to recognize and understand relationships; to analyse complex systems; to think of how systems are embedded within different domains and different scales; and to deal with uncertainty.

#### **Anticipatory competency**

the abilities to understand and evaluate multiple futures – possible, probable and desirable; to create one's own visions for the future; to apply the precautionary principle; to assess the consequences of actions; and to deal with risks and changes.

#### **Normative competency**

the abilities to understand and reflect on the norms and values that underlie one's actions; and to negotiate sustainability values, principles, goals, and targets, in a context of conflicts of interests and trade-offs, uncertain knowledge and contradictions.

#### Strategic competency

the abilities to collectively develop and implement innovative actions that further sustainability at the local level and further afield.

#### **Collaboration competency**

the abilities to learn from others; to understand and respect the needs, perspectives and actions of others (empathy); to understand, relate to and be sensitive to others (empathic leadership); to deal with conflicts in a group; and to facilitate collaborative and participatory problem solving.

#### **Critical thinking competency**

the ability to question norms, practices and opinions; to reflect on own one's values, perceptions and actions; and to take a position in the sustainability discourse.

#### **Self-awareness competency**

the ability to reflect on one's own role in the local community and (global) society; to continually evaluate and further motivate one's actions; and to deal with one's feelings and desires.

#### Integrated problem-solving competency

the overarching ability to apply different problem-solving frameworks to complex sustainability problems and develop viable, inclusive and equitable solution options that promote sustainable development, integrating the above-mentioned competences.

MOOC-like digital course with reading and video material for self-paced individual and group study of sustainability concepts and strategies, with reflection questions, discussion boards, quizzes, etc.

## Academic text with peer review

write a short academic paper "definitions of sustainability and relevance of sustainable engineering for your career", with anonymous peer-to-peer feedback and assessment.

### **Project-based learning**

inter-disciplinary group work to develop and evaluate a new technological business concept within a given theme (e.g., "energy crisis").

## Flipped classroom problems

in-class (or asynchronous) activity to discuss and reflect contents of the course. containing i) preparatory video and reading material, ii) problem description, and iii) digital tools, iv) digital channels for audio/video and written communication.

### **Auto-graded computational assignments**

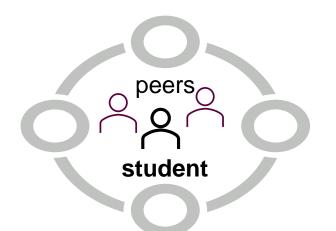

MOOC-like digital course with reading and video material for self-paced individual and group study of sustainability concepts and strategies, with reflection questions, discussion boards, quizzes, etc.

## Academic text with peer review

write a short academic paper "definitions of sustainability and relevance of sustainable engineering for your career", with anonymous peer-to-peer feedback and assessment.

### **Project-based learning**

inter-disciplinary group work to develop and evaluate a new technological business concept within a given theme (e.g., "energy crisis").

## **Project-based assignment**

INGx2300: 10 weeks, through the course

5-6 person groups, across minimum 2 engineering programs

Develop a business and technology concept for an *Energy crisis in Europe*, to describe

- Concept and market opportunities
- Costs and revenues
- Environmental and sustainability aspects.

Consider trends and change towards 2030.

## **Deliverables**

Week 1	Physical, at home campus.  Group formation, concept kick-off
Week 4	Digital support.  Group collaboration agreement
Week 6	Concept draft  Mid-term peer-to-peer presentation
Week 7 Week 10	Communication log Final report (summative grade)

## Flipped classroom

Individual classroom sessions, each of 2h.

Learning management system elements:

- Reading and other preparatory material.
- On-boarding quiz.
- Uses 3<sup>rd</sup> party and/or inhouse digital tools and simulators.
- Digital communication channels used during sessions (Zoom, discussion boards).

Entirely online (INGGX2300), or hybrid stream (e.g., TEP4295 in 2023).

## Session example: climate policy

- Groups are assigned a random country: gather sustainability information about the country, such as human development index, gross domestic product, energy and health statistics.
- 2. Negotiate within their group a global policy for achieving the Paris target of 1.5 degrees considering these other 'national' sustainability interests and needs.
- 3. Test and validate the climate policy with a **global climate policy simulator** (En-ROADS).
- **4. Present policies in open plenary and discuss** them from the perspective of the countries present.
- Involves a holistic perspective and system effects
- Understanding and negotiating views and values
- Critical reflection and integrated problem solving
- Collaborative and cooperative learning

## Flipped classroom

Individual classroom sessions, each of 2h.

Learning management system elements:

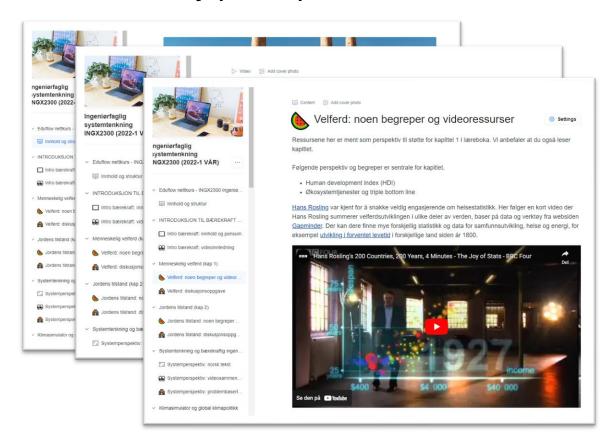

- Reading and other preparatory material.
- On-boarding quiz.
- Uses 3<sup>rd</sup> party and/or inhouse digital tools and simulators.
- Digital communication channels used during sessions (Zoom, discussion boards).

Entirely online (INGGX2300), or hybrid stream (e.g., TEP4295 in 2023).

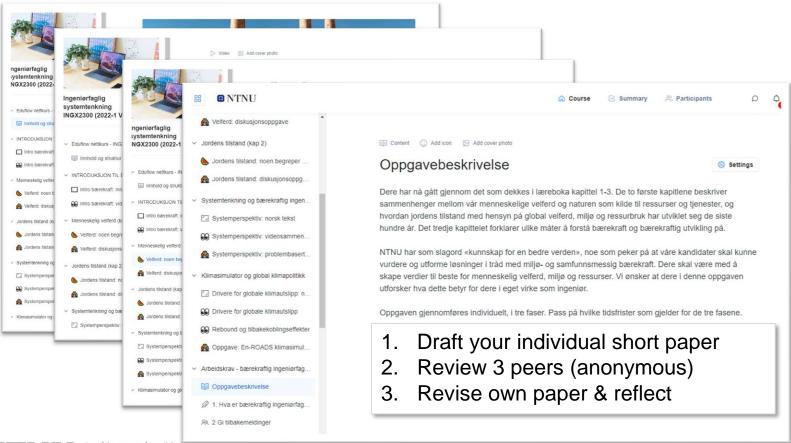

### Sessions

- Global climate policy, how to achieve Paris agreement of 1.5 degrees
- Simplified LCA: plastic vs reusable grocery-bag
- Allocation in LCA: milk farm products
- Material flow analysis: clothes in Norway
- Carbon footprint: one student year
- Energy assessment: windfarm concept
- Indigenous land rights: windmills
- Industrial symbiosis in process industry cluster

## Online self study (MOOC)

### Peer-to-peer review

MOOC-like digital course with reading and video material for self-paced individual and group study of sustainability concepts and strategies, with reflection questions, discussion boards, quizzes, etc.

## Academic text with peer review

write a short academic paper "definitions of sustainability and relevance of sustainable engineering for your career", with anonymous peer-to-peer feedback and assessment.

### **Project-based learning**

inter-disciplinary group work to develop and evaluate a new technological business concept within a given theme (e.g., "energy crisis").

Which one do you think is difficult to scale-up in a digital environment, and why?

## Flipped classroom problems

in-class (or asynchronous) activity to discuss and reflect contents of the course. containing i) preparatory video and reading material, ii) problem description, and iii) digital tools, iv) digital channels for audio/video and written communication.

### **Auto-graded computational assignments**

MOOC-like digital course with reading and video material for self-paced individual and group study of sustainability concepts and strategies, with reflection questions, discussion boards, quizzes, etc.

## Academic text with peer review

write a short academic paper "definitions of sustainability and relevance of sustainable engineering for your career", with anonymous peer-to-peer feedback and assessment.

### **Project-based learning**

inter-disciplinary group work to develop and evaluate a new technological business concept within a given theme (e.g., "energy crisis").

## Experiences

## Flipped classroom problems

in-class (or asynchronous) activity to discuss and reflect contents of the course. containing i) preparatory video and reading material, ii) problem description, and iii) digital tools, iv) digital channels for audio/video and written communication.

### **Auto-graded computational assignments**

MOOC-like digital course with reading and video material for self-paced individual and group study of sustainability concepts and strategies, with reflection questions, discussion boards, quizzes, etc.

## Academic text with peer review

write a short academic paper "definitions of sustainability and relevance of sustainable engineering for your career", with anonymous peer-to-peer feedback and assessment.

- Well received. Students speed through and revisit later.
- Replacement for the book?
- Few complete discussion problems, but also how many do the chapter questions for a book?
- Sometimes the pedagogics is lost (logo quiz example)

- Very good fedback on the task, and format
- «I have not written a text like this since high school»

- Highlights gaps in competence for programming
- Few make use of the training material
- Forces skills development but difficult to allow deep learning for sustainability

### **Auto-graded computational assignments**

- Generally, the more appreciated activity
- Difficult to provide feedback to groups; how can we scale-up formative assessment?

### **Project-based learning**

inter-disciplinary group work to develop and evaluate a new technological business concept within a given theme (e.g., "energy crisis").

## Experiences

- Activity-competence mapping identifies these as *integrative* activities
- Connect very many of the key competences
- Important for collaboration and strategic competence, and integrated problem solving.

- Diminishing participation through the semester
- Few active groups, many join as individuals
- The digital environment poses a significant challenge to engage active participation

# Flipped classroom problems

in-class (or asynchronous) activity to discuss and reflect contents of the course, containing i) preparatory video and reading material, ii) problem description, and iii) digital tools, iv) digital channels for audio/video and written communication.

MOOC-like digital course with reading and video material for self-paced individual and group study of sustainability concepts and strategies, with reflection questions, discussion boards, quizzes, etc.

## Academic text with peer review

write a short academic paper "definitions of sustainability and relevance of sustainable engineering for your career", with anonymous peer-to-peer feedback and assessment.

### **Project-based learning**

inter-disciplinary group work to develop and evaluate a new technological business concept within a given theme (e.g., "energy crisis").

## Experiences

## Flipped classroom problems

in-class (or asynchronous) activity to discuss and reflect contents of the course. containing i) preparatory video and reading material, ii) problem description, and iii) digital tools, iv) digital channels for audio/video and written communication.

### **Auto-graded computational assignments**

MOOC-like digital course with reading and video matrice for self-paced individue postudy of sustainal and strategies, with questions, discussion course, quizzes, etc.

## Academic text with peer review

write a short academic er "definitions of sust relevance of sust engineering for you with anonymous peer to peer feedback and assessment."

### **Project-based learning**

inter-disciplinary group work to de evaluate a new technological busin within a given theme (e.g., "energy crisis")

# Are they effective for student-centered learning at scale?

- They do enable autonomous and active participation, as individuals and groups
- Active participation promotes life-long learning competence such as growth mindsets, self-efficacy, and self-regulation.
- Some only engage the motivated students

## Flipped classroom problems

in-class (or asynchron to discuss contents of e, containing i) preparatory video and reading material, ii) problem description, and iii) digital tools, iv) digital channels for audio/video and written communication.

### **Auto-graded computational assignments**

self-grading assignments and training material (Jupyter Notebook, nb – grader): randomized mimicking textbook examples and problems i IOA, energy analysis, economic assess

## **Conclusions**

 Sustainable engineering and studentcentered learning can be supported in a digital environment.

However, it depends on use of integrative, less scalable activities.

 Successful scaling requires on-boarding and students' active ownership of learning.

Will also promote life-long learning ability: growth mindset, self-efficacy and self-regulation.

- Resource effectivity of education is a general challenge and not specific to sustainability education.
- Student-centered learning at scale is an under-researched topic, but likely requires change in both teacher and learner practices.
- Accessibility of Al tools underlines the importance of developing students' selfmotivation. New tools remove or reduce the applicability of assignments as "external motivation" for learning and learning activities.

## Thank you for your attention
